

NOTE

A new combination in the genus *Bergicoris* (Heteroptera: Rhyparochromidae: Myodochini), with distributional data for some species

DOI: 10.4289/0013-8797.121.2.311

The genus *Pseudocnemodus* was erected by Barber (1911) to include the new species *P. bruneri* that was subsequently synonymized under *P. canadensis* (Provancher) by Van Duzee (1912). This species is distributed in eastern Canada and the United States (Ashlock and Slater 1988), and shows a unique stridulatory mechanism among the Myodochini (Harrington 1980), formed by a stridulitrum over the propleuron and lateral surface of the head, and a plectrum as a row of tubercles on the profemur. Brailovsky (1981) described the second species in the genus, *P. martinezzi*, based on a single male from Paraguay with a stridulitrum over the propleura, but ‘visible only when a beam of intense light falls on it’. Brailovsky and Barrera (1984) noted the affinities between two Neotropical species of the genus *Cnemodus* Herrich-Schaeffer, *C. albimaculus* Berg and *C. multifarius* Berg, and *P. martinezzi*, and pointed out that these three species represented a new genus. Dellapé (2008, 2010) established the new genus *Bergicoris* to include *B. albimaculus* (Berg), *B. multifarius* (Berg), and the new species *B. riojanus*. Dellapé (2008) also showed that the description and photograph of *P. martinezzi* in Brailovsky’s (1981) paper indicated that it appeared to be congeneric with the species included in *Bergicoris*.

The first author had the chance of examine the male holotype of *Pseudocnemodus martinezzi* deposited in the Instituto de Biología (UNAM), and

corroborated that it belonged in *Bergicoris*. Consequently, *Bergicoris* now includes four Neotropical species, and the genus *Pseudocnemodus* contains only *P. canadensis*, with a Nearctic distribution.

Bergicoris Dellapé, 2010

Included species.

B. albimaculus (Berg, 1878)

<http://lsid.speciesfile.org/urn:lsid:Lygaeoidea.speciesfile.org:TaxonName:491507>

Material examined.—Lectotype male, Banda Oriental, 1478, *Cnemodus albimacula* (MLP); Paralectotype female, typus, Banda Oriental, 1478 (MLP); 1 male, 1 female, Santa Fe, Maggiolo, II-1978 (MLP).

Distribution.—Argentina: Córdoba and San Luis. Uruguay (Dellapé, 2008, 2014; Dellapé & Henry, 2019). Santa Fe province is a new record from Argentina.

B. multifarius (Berg, 1894)

<http://lsid.speciesfile.org/urn:lsid:Lygaeoidea.speciesfile.org:TaxonName:491508>

Material examined.—Holotype female, [Bolivia] Tarija (MACN); 2 males, 1 female, Argentina, Catamarca, El Unquillo, 19-V-1963 (MLP); 1 male, Jujuy, Calilegua, IV-[19]79 (MLP); 1 male, Argentina, Mendoza, Las Heras, Monumento a Canota, ruta 52, 32°37' 13.26" S 78°54'48.38" W, 962 m, 8/17-II-[20] 05, S. Claver & A. Scollo colls. (MLP); 2 males, Argentina, Salta, H. Güemes,

Duret coll., Museum Paris coll. Duret 788/93 (MNHN).

Distribution.—Argentina: Córdoba, Tucumán, and Salta. Bolivia (Dellapé, 2008, 2014; Dellapé & Henry, 2019). Catamarca, Jujuy, and Mendoza provinces are new provincial records from Argentina.

B. riojanus Dellapé, 2008
<http://lsid.speciesfile.org/urn:lsid:Lygaeoidea.speciesfile.org:TaxonName:491509>

Material examined.—Holotype male, Argentina: La Rioja: Ilías, Mateo Gómez col. (MACN). Paratypes: 1 male, 2 females, Argentina, La Rioja, Ilías, Mateo Gómez col. (MACN).

Distribution.—Argentina: La Rioja (Dellapé, 2008, 2014; Dellapé & Henry, 2019).

B. martinezzi (Brailovsky, 1981), **new combination**
<http://lsid.speciesfile.org/urn:lsid:Lygaeoidea.speciesfile.org:TaxonName:480788>

Material examined.—Holotype male, Paraguay, Caaguazú, diciembre 1977, Antonio Martínez (UNAM).

Distribution.—Paraguay.

Examination of the male holotype of this species has shown that it lacks a propleural stridulitrum. The propleural cuticle is irregular and transversely corrugated but it does not correspond with a true stridulatory structure.

Bergicoris martinezzi, n. comb. is similar to *B. albimaculus* in general coloration, especially the uniformly colored distiflagellomere, the contrastingly darker humeral angles, and the dark almost black abdomen; nevertheless, *B. martinezzi* differs from *B. albimaculus* in the absence of a yellowish subapical spot on the hemelytron, and the less inflated anterior pronotal lobe in the male.

ACKNOWLEDGMENTS

We thank Harry Brailovsky (Universidad Nacional Autónoma de México) for his hospitality and support during PMD's visit to the entomological collection of the Instituto de Biología in 2017. This work was funded in part by the Consejo Nacional de Investigaciones Científicas y Técnicas- CONICET, Argentina.
